

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

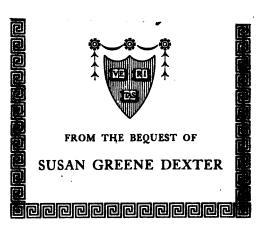

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

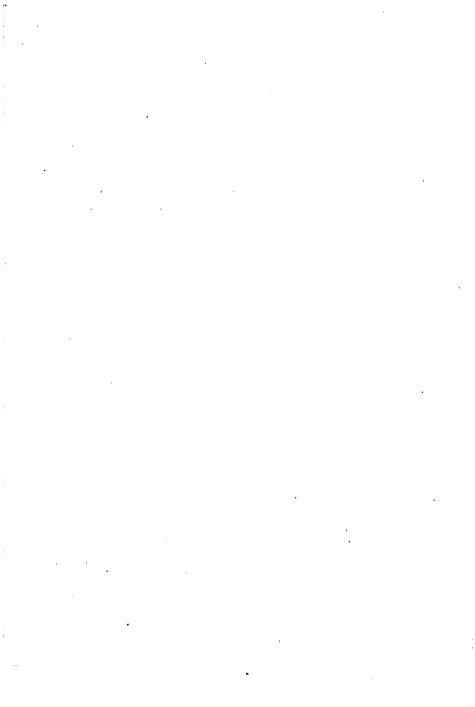

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

PREFACE TO NEW EDITION.

This extensive collection of Mathematical Tables comprehends the most important of those required in Trigonometry, Mensuration, Land-surveying, Navigation, Astronomy, Geodetic Surveying, and the other practical branches of the Mathematical Sciences.

This new and greatly enlarged Edition is well adapted for general use, and will be found to be more convenient, in size and arrangement, than any other compilation of the kind. The Tables of Logarithms of Numbers, of Logarithmic Sines, Tangents, and Secants; also those of Natural Sines, Cosines, Versed Sines and Chords, Tangents and Cotangents, Secants and Cosecants, and of Circular Arcs, are carried to seven decimal places, and are so arranged that the functions required in any calculation may all be found, so far as possible, at the same opening of the book.

As accuracy is the most important element in such tables, the greatest care has been bestowed in collating the whole with the best editions of the tables of Taylor, Hutton, Callet, Köhler, Schrön, and Shortrede; and wherever any difference has been found, the logarithms so differing have been calculated anew, so that it is confidently hoped these Tables will be found at least as accurate as any set hitherto published.

EXPLANATION OF THE TABLES.

COMMON LOGARITHMS.

(1) A Table of Logarithms is a collection of anxiliary numbers, so constructed, that by it Multiplication of common numbers can be performed by addition of their Logarithms; Division by their subtraction; Involution, or raising of powers, by their multiplication; and Evolution, or extraction of roots, by their division. These auxiliaries or Logarithms are the exponents or powers to which an invariable number called the base has to be raised, in order to produce the number of which it is the Logarithm.

The above expressed in algebraic symbols, where $\bf A$ and $\bf B$ represent two numbers, is

(a) Log.
$$(A \times B)$$
 = log. $A + \log B$.
(b) Log. $\frac{A}{B}$ = log. $A - \log B$.
(c) Log. A^n = $n \log A$.
(d) Log. $\sqrt[n]{A} = \text{Log. } A^{\frac{1}{n}}$ = $\frac{1}{n} \log A$.

(2) In the following Tables of common logarithms, the base = 10, and the power to which 10 has to be raised to produce any number, is therefore the logarithm of that number; thus,

If, beginning again with 10¹, we divide successively by 10, we obtain the following results:

When we find from the Table that log. 35 = 1.5440680, this means that $10^{1.5440680} = 10^{1.5440680} = 35$; or that, if 10 be raised to a power denoted by the numerator of the fractional exponent, and of the number so found the root indicated by the denominator be extracted, the result will be 35. Other logarithms are to be similarly interpreted.

- (3) From the above it appears that the common Log. 1 = 0, that Log. 10 = 1; hence, the logarithms of numbers greater than 1 and less than 10, will be greater than 0 and less than 1; in other words, will be some proper fraction or decimal, without an integer; that the logarithms of all numbers greater than 10 but less than 100, will be greater than 1 and less than 2, or will be 1 + a decimal; while the logarithm of a number consisting of 3 integral figures will be 2 + a decimal, and so on; the integral part of the logarithm being always one less than the number of integral figures in the number of which it is the logarithm.
- (a) Definition.—The integral part of a logarithm is called its characteristic, and the decimal part is called the mantissa.
- (4) It also appears that the logarithms of all proper fractions are negative; thus, the logarithm of $\frac{1}{2}$ or \log ·75 is $(1, b) \log$ ·8 \log ·4, or ·4771218 ·6020600 = ·1249387; but subtracting this from 0, the logarithm of 1, we have $\overline{1}$ ·8750613, where the characteristic only is negative, and the mantissa is positive, and consists of the same figures as the mantissa of \log ·75, which is 1·8750613; from which it appears that the mantissa of the logarithm of a number is the same, so long as the digits of the number remain the same, and that the characteristic alone changes according to the position of the decimal point; thus,

Log. 43758 = 4.6410575Log. 4375.8 = 3.6410575Log. 437.58 = 2.6410575Log. 43.758 = 1.6410575Log. 4.3758 = 0.6410575Log. 43758 = 1.6410575Log. 043758 $= \overline{2}.6410575$ Log. .0043758 $= \overline{3}.6410575$ &c. &c.

- (a) This property of the characteristic and mantissa is only true of logarithms whose base is the same as the root of the scale of arithmetical notation; it is not true of Naperian logarithms; hence, a table of Naperian logarithms, in order to be universally useful, would require to be infinite in extent. For this reason a table of common logarithms is far more general, and more easily used than logarithms calculated to any other base.
- (5) The Characteristic.—From what has been said above, and from the fact that only the *mantissa* of the logarithm is put in the Table, the *characteristic*, in each case, must be supplied by the calculator himself. This is done by the following easy Rules.

- (a) If the number whose logarithm is sought contain one or more integral figures, the characteristic is always one less than the number of integral figures in the number, and is positive.
- (b) If the number is wholly a decimal, its characteristic is the same as the place from the decimal point which its first significant figure occupies, and is negative: in this case the negative sign is placed over the characteristic, to shew that it alone is negative, the mantissa being always positive.
 - (6) TO FIND THE LOGARITHM OF A GIVEN NUMBER BY THE TABLES.
- (a) If the number consist of not more than three figures: the mantissa will be found opposite it on one of the first five pages; and the characteristic must be supplied by (5, a) or (5, b), according as it contains an integer, or is all a decimal. In this manner is found,

Log. 852 =
$$2.9304396$$

and Log. $.45$ = $\overline{1.6532125}$

(b) If the number contain four digits: the mantissa will be found on pages 6 to 185 under 0 at the top of the page, and opposite the number itself in the column marked No. at the left-hand side of the page; and the proper characteristic must be applied as in the last case. In this manner is found,

Log.
$$374.5 = 2.5734518$$

and Log. $.03745 = \overline{2}.5734518$

(c) If the number contain five digits: the mantissa will be found on pages 6 to 185, opposite the first four figures on the left-hand side of the page, and under the fifth at the top. In this way it is found that

Log.
$$87647 = 4.9427371$$

and Log. $.78539 = \overline{1.8950854}$

(d) If the number whose Logarithm is sought contain six or seven figures: find the mantissa corresponding to the first five figures as directed in (c); then take the difference between this logarithm and the next higher in the table, which is the change in the logarithm corresponding to an increase of 1 or a unit in the fifth figure of the number. Now, the sixth figure is tenth parts of this unit, and the sixth and seventh are hundredth parts of this unit; in other words, are decimals in reference to it. Hence, if the difference found above be multiplied by the figures above five, considered as decimals, and the product added to the logarithm found as above, it will be the true logarithm sought; thus: Find the logarithm of 387548.

Find the logarithm of 276.5473.

```
Here Log. 276:55 = 2.4417737

Log. 276:54 = 2.4417580

their diff. is = 157

and 157 × ·73 = 114·61 or 115 = correction

∴ Log. 276:5473 = 2.4417695
```

(7) PROPORTIONAL PARTS BY INSPECTION.

These corrections can also be more readily made, by means of the columns of proportional parts to be found on the right-hand side of each page; thus, under diff. 112, and opposite 8, is found 90, which being added to the last figures of the log. 38754, gives log. 387548 as above. Also, under the difference 157, and opposite 7, is found 110, and opposite 3 is found 47; but 3 being in the seventh place, 47 must be taken as 4.7; which, being nearer to 5 than 4, must be taken as 5; and this added to the 110 gives 115 as the correction to be added to the log. 276.54, to obtain the logarithm of 276.5473; the result being the same as found above.

- (a) The differences change so rapidly at the beginning of the Tables, that for want of room, only every third difference is given, from page 1 to 13, and every second difference, from page 14 to 23: from page 24 to end, every difference is given. When the exact difference is not given, use that which difference it only by one, and the result will be sufficiently exact for ordinary purposes; but, when the greatest accuracy is required, correct by the rule (d) above.
- (b) The logarithms of numbers from 100000 to 108000 are given on pages 186 to 201, to eight places of decimals; they are to be taken out exactly as described above, five figures of the number being found at the beginning of the page, and the sixth at the top; the correction for the 7th and 8th figures of the number is made as described (6 and 7) above.

	EXERCISES.		
1. The logarithm of	729	=	2.8627275
2. The logarithm of	4.385	=	0.6419696
3. The logarithm of	53874	=	4.7313792
4. The logarithm of	53 ·87 4 5	=	1.7313833
5. The logarithm of	003768	=	3·5761109
6. The logarithm of	7853968	=	6.8950891
7. The logarithm of .78	35 39816	=	T·8950899
8. The logarithm of 10	47.3564	=	3·02009449 (7, b)

(8) TO FIND THE NUMBER CORRESPONDING TO A GIVEN LOGARITHM.

When the logarithm is not found in the table, take out the next lower and the five figures of the number belonging to it; then, find the difference between this logarithm and the given one, and under the corresponding tabular difference find the proportional part which is equal to this difference, and opposite it is found the sixth figure of the number: but if the difference is not exactly found among the proportional parts, take the next lower part, and the figure opposite it is the sixth figure of the number; subtract this part from the given difference, annex to the remainder a cipher, consider it as a new proportional

part, and find the corresponding figure as before, and it will be the seventh figure of the number.

EXAMPLE.

Find the number whose logarithm is 3.9212074.

Given logarith	ım.	=	3.92	12074
Number = 83	340.7 to next lower log.	=	3.92	12025
				49
Number =	09 to next lower pro. par	t	=	47
				20
Number $=$	004 to nearest pro. part		=	21
Hence 88	340·794 is the required numb	er.		

COMPUTATION OF NEGATIVE CHARACTERISTICS.

It is usual to make only the characteristic of a logarithm negative, as the calculations can thus be made more conveniently. Calculations with negative characteristics are made according to the rules of algebraic addition and subtraction.

- (9) (a) To add two negative characteristics.

 Take their sum, and make it negative. Thus 2 added to 3, gives 5.
 - (b) To add a positive and negative characteristic.

Take their difference, and consider it to be positive or negative according as the positive or negative characteristic is the greater; that is, the difference has the sign of the greater.

Thus 6 and $\overline{2}$ give 4; 5 and $\overline{2}$ give 3; $\overline{5}$ and 2 give $\overline{3}$; $\overline{2}$ and 1 give $\overline{1}$; and so on.

The following examples will easily be performed by attending to these two rules:

EXAMPLES.

1. Add 5.3468541 and 3.2685427
5.3468541
3.2685427
2.6153968
2. Add 6.3874654 and 2.9245636
6.3874654
2.9245636

5·3120290

In this example the sum in the first decimal place is 13, and the 1 is carried to 6, which gives 7, then 7 and $\overline{2}$ give 5.

3. Add 2:5632874 and 3:2465281 2:5632874 3:2465281 5:8098155 (10) To subtract a negative characteristic.

Change its sign to plus, and then add it by the preceding rules for addition. Thus, to subtract $\overline{3}$ from 2, the result is found by adding 3 to 2, which gives 5. So $\overline{5}$ subtracted from $\overline{2}$, gives 5 and $\overline{2}$, or 3; also $\overline{3}$ subtracted from $\overline{5}$, gives 3 and $\overline{5}$, or $\overline{2}$.

EXAMPLES.

1. From **2.684**7658 subtract 3.2468543

2.6847658

3·2468543

5·4379115

2. From 2.8468537 subtract 5.7654626

2·3468537

5·7654626

2.5813911

Here $\overline{5}$ taken from $\overline{2}$, gives 5 and $\overline{2}$, or 3; but in subtracting the first decimal places, there is one to be carried; in other words, 1 is to be subtracted from the upper number $\overline{2}$, which makes it $\overline{3}$, then $\overline{3}$ and 5 give 2.

3. From 5.6843252 sul

5.6843252 subtract 3.7856310

5.6843252

3.7856310

3.8986942

Here $\overline{3}$ taken from 5, gives 3 and $\overline{5}$ or $\overline{2}$, and a 1 of carriage, which is of course to be subtracted, gives $\overline{2}$ and $\overline{1}$ or $\overline{3}$; or the 1 of carriage, with the $\overline{5}$ makes $\overline{6}$, and $\overline{3}$ taken from $\overline{6}$, gives 3 and $\overline{6}$ or $\overline{3}$.

(11) To multiply a logarithm with a negative characteristic.

Multiply the fractional part by the common rules; then multiply the negative characteristic, which will give a negative product, and add the carriage to it by the rule (b) above.

Thus $\overline{2}$, multiplied by 5, gives $\overline{10}$, and if 2 of carriage is to be added, the result is $\overline{8}$.

EXAMPLES.

1. Multiply 2.3685464 by 2

2·3685464

4.7370928

2. Multiply 3.7856473 by 6

3.7856473

6

14.7138838

Here $\overline{3} \times 6 = \overline{18}$, and $\overline{18}$, with the carriage 4, gives $\overline{14}$.

(12) To divide a logarithm having a negative characteristic.

If the characteristic is divisible by the divisor, write down the quotient with a negative sign, and divide the fractional part by common rules. But if the negative characteristic is not divisible by the divisor, add such a negative number to it as will make it divisible, and prefix an equal positive integer to the fractional part of the logarithm; then divide the increased negative exponent and the other part of the logarithm separately, and the former quotient, taken negatively, will be the characteristic to the fractional part of the quotient.

Thus $\overline{6}$, divided by 3, gives $\overline{2}$. But to divide $\overline{10}$ by 3, add $\overline{2}$ to it, and then $\overline{10}$ is equal to $\overline{12}$ and 2; the former, divided by 3, gives $\overline{4}$, and the latter $\frac{2}{3}$. The quotient, therefore, is $\overline{4}$ and $\frac{2}{3}$.

EXAMPLES.

1. Divide

 $\overline{6} \cdot 3246846$ by 3 $\overline{6} \cdot 3246846 \div 3 = \overline{2} \cdot 1082282$

2. Divide

 $\overline{14}$:3268472 by 9 $\overline{14}$:3268472 = $\overline{18}$ + 4:3268472

and the quotient is

 $= \overline{2} \cdot 4807608$

Here 4 must be added to $\overline{14}$, that the sum $\overline{18}$ may be divisible by 9; and as $\overline{4}$ is thus added, therefore 4 must be prefixed to the fractional part, and thus the value of the logarithm is unaltered, for there is added to it $\overline{4}$ and 4, or 0.

(13) To Perform Multiplication by Logarithms.

Add the logarithms of the factors, and the sum will be the logarithm of the product.

EXAMPLES.

1. Multiply

2.581926 by 345.7291. L 2.581926 = 0.4119438 } L 345.7291 = 2.5387359 }

Product = 892.647, its log.

= 2.9506797 Sum.

2. Multiply

•03902, 59·716, and •00314728. L •03902 = $\overline{2}$ ·5912873)

L 59.716 = 1.7760907 $L .00314728 = \overline{3}.4979353$

Product = .007333533, its log.

 $= \overline{3.8653133}$ Sum.

EXERCISES.

1. Multiply 231.4 and 5.062.

Ans. 1171.347.

2. Multiply 35.86, 2.1046, .8372, and .00294.

Ans. 1857618.

(14) To Perform Division by Logarithms.

From the logarithm of the dividend subtract that of the divisor, and the remainder will be the logarithm of the quotient.

EXAMPLES.

371.49 by 52.376. 1. Divide L871.49 = 2.5699471) L 52.376 = 1.7191323

Quotient = 7.092752

0.8508148 Diff.

2. Divide

·07438 by 129·476. $L \cdot 07438 = \overline{2} \cdot 8714562$) L 129.476 = 2.1121893

Quotient = .0005744694

4·7592669 Diff.

EXERCISES.

1. Divide 241.63 by 4.567.

Ans. 52.90782.

Divide '6314 by '007241.

Ans. 87·19792.

(15) To Perform Proportion by Logarithms.

Add together the logarithms of the second and third terms, and from their sum subtract the logarithm of the first, and the remainder will be the logarithm of the fourth term.

- (a) The arithmetical complement of a number is the remainder, after subtracting it from a number consisting of 1, with as many ciphers annexed as the number has of integers. When the index of a logarithm is less than 10, which is generally the case, its arithmetical complement is found by subtracting it from 10.
- (b) The arithmetical complement of a logarithm is easily found by subtracting its right-hand significant figure from 10, and all those before it from 9.

Instead of subtracting the logarithm of the first term, its arithmetical complement may be added to the logarithms of the second and third, and the sum, after deducting 10 from the index, will be the logarithm of the fourth term.

Find a fourth proportional to 723.4, .02519, and 3574.862.

As	723· 4	2·8593785	ar. com.	7.1406215
To	.02519	2·4012283		2 ·4012282
So is	3574·862	8.5582592		3.5532592
		1.9544874		T·0951089
To	1244827	Ī·0951089		

In the first method, the logarithms of the second and third terms are added. and that of the first term is then subtracted from the sum; and in the second method, the arithmetical complement of the logarithm of the first term is added to the logarithms of the second and third, and from 9 the index 10 is subtracted, which gives I for a remainder.

(c) The arithmetical complement of a number is also sometimes understood to be the algebraic remainder after subtracting the number from zero or nothing. Instead of subtracting a number from another, if this arithmetical complement

of the former is added to the latter, the sum will be the required difference without deducting 10 or any other number. Thus, in the above example,

A. C.* of L 728·4 = 3·1406215 L ·02519 = 2·4012282 L 8574·862 = 8·5532592 T·0951089

which is the same result as before.

(16) To Perform Involution by Logarithms.

Multiply the logarithm of the given number by the exponent of the power to which it is to be raised, and the product will be the logarithm of the required power.

EXAMPLE.

Find the cube of 30.7146.

L 80.7146 = 1.4873449

Power = 28975.75, its log.

 $=\overline{4.4620347}$

EXERCISES.

1. Find the fourth power of 9.163.

Ans. 7049.88.

2. Find the 365th power of 1.0045.

Ans. 5.149062.

(17) To Perform Evolution by Logarithms.

Divide the logarithm of the given number by the exponent of the root which is to be extracted, and the quotient will be the logarithm of the required root.

EXAMPLES.

1. Find the cube root of 12845.

L 12345 = 4.0914911

Its quotient by 3

= 1.8638304 = L 23.11162

Hence $\sqrt[3]{12845} = 28.11162$

2. Find the fourth root of .0076542.

 $L \cdot 0076542 = \overline{3} \cdot 8838998$

Its quotient by 4 (by 12)

= T.4709749 = L.295784

Hence 4 0076542 = 295784

(18) To yind the value of x in the equation $a^x = b$.

By (1, c) we have
$$x$$
 Log. $a = \text{Log. } b$.

$$\therefore x = \log b + \log a$$
Let $a = 40$, and $b = 10$

Then $x = \frac{1.6020600}{1.0000000} = 1.60206$

* A. C. is a contraction for arithmetical complement.

Next,

let
$$a = .8$$
, and $b = 3.1416$
Then $x = \frac{\text{Log. } 3.1416}{\text{Log. } \cdot 8} = \frac{0.4971509}{1.9030900}$

$$= \frac{0.4971509}{-0.0969100}$$

$$= -\frac{.4971509}{.0969100} = -\frac{4971509}{969100}$$

$$= -5.130027$$

In this latter case we have to change the divisor T-9030900 into --0969100° before the division can be conveniently performed.

(19) TO FIND THE AMOUNT AND PRESENT VALUE OF A SUM OF MONEY AT COMPOUND INTEREST BY LOGARITHMS.

Let
$$p =$$
 the principal,
 $a = n$ amount.

t = " time or number of payments of interest,

r = " interest of £1 for one period,

$$(1+r) = R = *$$
 amount of £1 for one period.

Then (Algebra, 666),
$$a = p R^t$$
 (1)

which, by taking the logarithms of both sides, becomes

$$Log. a = log. p + t log. R,$$
 (2)

Transposing

$$Log. p = log. a - t log. R,$$
 (3)

$$Log. R = \frac{\log. a - \log. p}{t}, \tag{4}$$

$$t = \frac{\log a - \log p}{\log R}.$$
 (5)

Also the interest

$$= a - p = p \left(\mathbf{R}^t - 1 \right) \tag{6}$$

Note.—If in the above formulæ p = the present value of a sum a due t periods hence, they are equally true for the present value; t, r, and R being the same as above.

When t is large, the logarithm of R, in order to obtain correct results, should be taken with more than seven places of decimals; for which reason the most common values of R, with their logarithms carried to ten decimals, are inserted in the following table:

LOGARITHMS OF R.

R.	Logarithm.	, R.	Logarithm.
1.0025	00108,43813	1.0325	01389,00603
1.0050	. 00216,60618	1.0350	01494,03498
1.0075	. '00324,50548	.1.0375	01598,81054
1.0100	. 00432,13738	1.0400	01703,33393
1.0125	. 00539,50319	1.0425	01807,60636
1.0150	. 00646,60422	1.0450	01911,62904
1.0175	. 00753,44179	1.0475	02015,40316
1.0200	. 00860,01718	1.0500	02118,92991
1.0225	. '00966,33167	1.0525	02222,21045
1.0250	01072,38654	1.0550	02325,24596
1.0275	. 01178,18305	1.0575	02428,03760
1 0300	01283,72247	1.0600	02530,58653

EXAMPLE I.

Find the amount and compound interest of £365, 10s., for 19 years at 4½ per cent.

Since the rate per cent. is 4.25, the rate for £1 = r = .0425, and R = 1.0425, t = .19, and p = .365.5; then by (2),

t log. R = 19 × 0180760636 = 0.8434452084
+ log.
$$p = log. 365.5$$
 = 2.5628874
 $\therefore log. a = log. 805.9954$ = 2.9063326
 297
 $2908 \div 54 = 54.$

Hence the amount = £805, 19s. 11d.+

Also the interest = a - p by (6) = £805, 19s. 11d. - £365, 10s. = £440, 9s. 11d.

EXAMPLE II.

Find the present value of £584, 15s. 6d., due 12 years hence, compound interest at 31 per cent.

Since the rate per cent. is 3.5, the rate for £1 = r = .035, and R = 1.035, t = 12, and a = £584.775; then by (3),

Log.
$$a = \log$$
. 584·775 = 2·7669888
- $t \log$. $R = -12 \times \cdot 0149403498 = 0·1792841976$
 $\therefore \log p = \log$. 386·9943 2·5877046024
6997
113)49024
Hence $p = £386$, 19a. 103d. -

EXAMPLE III.

At what rate per cent. will £365, 10s. amount to £805, 19s. 11d. in 19 years? Here a = 805.995, p = 365.5, and t = 19; hence by (4),

Log. R =
$$\frac{\log a - \log p}{t}$$

= $\frac{2.9063324 - 2.5628874}{19}$
= $\frac{0.3434450}{19} = .0180761$ nearly
= $\log 1.0425$ \therefore R = 1.0425
 $r = .0425$, and the rate per cent. is therefore
= $4.25 = 4\frac{1}{4}$, the rate sought.

Hence

EXAMPLE IV.

In what time will £250 amount to £846, 11s. $9\frac{1}{2}$ d., at 5 per cent. per annum? Since a = 846.5885, p = 250, R = 1.05, by (5),

$$t = \frac{\log a - \log p}{\log R} = \frac{2 \cdot 9276723 - 2 \cdot 3979400}{0211893}$$
$$= \frac{\cdot 5297328}{\cdot 0211893} = 25 \text{ years, the time sought.}$$

EXAMPLE V.

Find the present value of £3245 due 30 years hence at 4½ per cent., compound interest.

Here a = 3245, R = 1.045, and t = 30; hence by the Note and (3),

Log.
$$p = \log a - t \log R$$
,
or $\log p = \log 3245 - 30 \times \log 1045$
 $= 3.5112147 - 5734887120$
 $= 2.987725988 = \log .866415$
 \therefore the present value = £866, 8s. $3\frac{1}{2}$ d. nearly.

EXAMPLE VI.

The present value of £596 due 12 years hence, compound interest, is £383, 3s. 4\frac{1}{4}d.; what is the rate per cent. per annum?

Here a = 596, p = 383.168, t = 12; hence by the Note and (4),

Log. R =
$$\frac{\log. a - \log. p}{t}$$

= $\frac{2.7752463 - 2.5833893}{12}$
= $\frac{.1918570}{12} = .0159881$
= Log. 1.0375 = log. R;
• R = 1.0375, and the rate per cent. is 34.

(20) To find the amount and present value of an annuity, for a given time, at a given rate per cent. compound interest.

Let p = the annual or periodic payment;

A = the amount of the annuity improved at compound interest to the end of the time;

v = the present value of the annuity;

R =the amount of £1 for one period;

and t = the number of years, or periods of payment.

Then

$$A = p\left(\frac{Rt - 1}{R - 1}\right) (Alg., art. 671),$$
 (7)

$$v = \frac{p(R^t - 1)}{R^t(R - 1)} = \frac{1}{R^t} A (Alg., art. 672);$$
 (8)

 $\therefore \text{ also } \mathbf{A} = v \mathbf{R}^t. \tag{9}$

Hence from (7),

Log.
$$A = \log_{t} p + \log_{t} (R^{t} - 1) - \log_{t} r;$$
 (10)

from (8),

Log.
$$v = \log_{10} p + \log_{10} (Rt - 1) - \log_{10} r - t \log_{10} R;$$
 (11)

and from (9),

$$Log. A = log. v + t log. R.$$
 (12)

Transposing (12),

$$Log. R = \frac{\log. A - \log. v}{r}.$$

REDUCTION OF COMMON TO NAPERIAN LOGARITHMS, AND THE CONVERSE.

- (21) The method of using the tables will be seen from the two following examples:
- 1. Find the Naperian logarithm corresponding to the common logarithm 0.9542425.

Com. Log.				Nap. Log.

LOGARITHMIC SINES, TANGENTS, AND SECANTS.

The logarithmic sines, tangents, &c. are the logarithms of the numbers that express the lengths of these lines for any given arc, supposing the radius of the circle to be 10,000,000,000.

- (22) To find the logarithmic sine of an arc.
- (a) When the arc contains degrees and minutes only.

If the number of degrees is under 45, find them at the top of the table, and in the column marked sine at the top, and opposite to the number of minutes in the left-hand column, is the required logarithm.

If the number of degrees exceeds 45, and is less than 90, they will be found at the foot of the page; and in the column marked sine at the foot, and opposite to the number of minutes in the right-hand column, will be found the required logarithm.

The same rule applies to tangents, cotangents, and all the other trigonometrical quantities.

EXAMPLES.

The	log.	sine of	36° 24′	is	9.7733614
"		secant	36° 50′	ø	10.0967023
#	#	tangent	53° 36′	"	10.1323772
#	,,	cotangent	53° 40′	,,	9.8665644

(b) When the arc contains degrees, minutes, and seconds.

Find the logarithm for the number of degrees and minutes as before, and multiply the tabular difference in the difference column next this logarithm by the number of seconds; divide the product by 60, and add the quotient as a proportional part to the preceding logarithm.

If the given quantity is a cosine, cotangent, or cosecant, the proportional part for the seconds must be subtracted from the logarithm for the degrees and minutes.

EXAMPLES.

1. Find the logarithmic tangent of 36° 40′ 50".

″*1

2. To find the logarithmic cosecant of 53° 20' 24".

The rule depends on this principle: The tabular difference for any logarithm is the difference between it and the next higher, and therefore is the difference corresponding to 60''; hence if D denote the tabular difference, and d the proportional part to be added for the number of seconds n, then

60 :
$$n = D$$
 : d , and $d = \frac{nD}{60}$

This supposes the differences to be constant, which is nearly the case for several consecutive logarithms.

EXERCISES.

- 1. Find the logarithmic sine of 36° 24′ 36″.

 Ans. 9.7734642.

 Prind the logarithmic extension of 52° 29′ 42″

 Ans. 9.8684953
- 2. Find the logarithmic cotangent of 53° 32′ 42″. Ans. 9.8684953.
- (23) To find the number of degrees, minutes, and seconds corresponding to any logarithmic sine, tangent, or secant.
 - (a) When the logarithm is found in the tables.

The number of degrees will be found at the top or foot of the page, according as the name of the logarithm is at the top or foot of the column, and the minutes are found in the proper column, as in (22).

EXAMPLES.

- 1. The log. tan. 9.8673583 corresponds to 36° 23'.
- 2. The log. cos. 9.7776128 corresponds to 53° 11'.
- (b) When the given logarithm is not found in the table exactly.

Find the next lower logarithm in the proper column, and take the degrees and minutes corresponding to it when it is a sine, tangent, or secant; find the difference between this logarithm and the given one; multiply this difference by 60, and divide by the tabular difference, and the quotient will be the number of seconds required.

(c) When the given logarithm is that of a cosine, cotangent, or cosecant, it is to be taken from the next higher logarithm in the table, and the seconds found from the remainder as above.

EXAMPLES.

1. Find the degrees, minutes, and seconds corresponding to the logarithmic sine 9.9047423.

Next lower Given log.
$$9.9047106 = log.$$
 sine $53^{\circ} 25'$ 9.9047423 Difference $= \frac{317}{937}$ and tab. diff. $= 937$.

Hence $n = \frac{317 \times 60}{937} = 20''.3$ and $9.9047423 = log.$ sine $53^{\circ} 25' 20''.3$.

2. Find the number of degrees, minutes, and seconds corresponding to the logarithmic cosecant 10.2280452.

Next higher Given log. $10 \cdot 2281850 = \log$ cosec. $36^{\circ} 15'$ $10 \cdot 2280452$ Difference $= \frac{1398}{1722} \times \frac{60}{1722} = 48'' \cdot 7$

and 10.2280452 = log. cosec. 36° 15' 48".7

The rule depends on the proportion in article 22, or

D:
$$d = 60$$
: n , and $n = \frac{60d}{D}$

EXERCISES.

- Find the degrees, &c. corresponding to the logarithmic tangent 9:8644658.
 Ans. 36° 12′ 4″·6.
- Find the degrees, &c. corresponding to the logarithmic cotangent 9.8734523.
 Ans. 53° 13′ 55″.

RULES FOR SMALL ARCS.

(24) The differences for the logarithmic sines and tangents of small arcs, not exceeding 3° 15′, are very variable, and therefore the logarithmic sines and tangents for such a small arc containing seconds cannot be accurately found,

since the proportional part is computed on the supposition that the differences are constant for a difference of 60" in the arc. Hence if the logarithmic sine of an arc nearly 90° were to be found by using that of a small arc obtained in the usual way, the error in this logarithm would cause an error of several seconds on the former arc, because the differences corresponding to 60" for arcs nearly 90° are comparatively small. For the same reason, when the logarithmic sine or tangent of a small arc is given, the arc cannot be accurately found in the usual way. It is seldom such small angles enter into calculations, but when they do so, they or their logarithmic sines or tangent may be calculated by the subjoined rules.

(25) To find the logarithmic sine of a small arc.

To the logarithm of the arc reduced to seconds add 4.6855749, and from the sum subtract \(\frac{1}{2}\) of its logarithmic secant, the index of the latter logarithm being previously diminished by 10; the remainder is the required logarithmic sine.

EXAMPLE.

Find the logarithmic sine of 1° 44′ 86".8.

$$a = 1^{\circ} 44' 36'' \cdot 8 = 6276'' \cdot 8, \text{ and its log.} = \frac{8.7977383}{4 \cdot 6855749}$$

$$-\frac{1}{2} \text{ (Log. sec. } a - 10) = \frac{1}{2} \times 0002011 = \frac{0.0000670}{0.000670}$$
Hence log. sine of 1° 44' 36'' \cdot 8 = \frac{8.4832462}{8.4832462}

(26) To find the logarithmic tangent of a small arc.

To the logarithm of the arc reduced to seconds add 4.6855749, and two-thirds of the logarithmic secant, the index of the latter logarithm being previously diminished by 10; the sum is the required logarithmic tangent.

EXAMPLE.

Find the logarithmic tangent of 1° 44′ 36".8.

$$a = 1^{\circ} 44' \ 36'' \cdot 8 = 6276'' \cdot 8, \text{ and its log.} = \frac{8.7977888}{4 \cdot 6855749}$$

$$- \frac{4 \cdot 6855749}{8 \cdot 4833132}$$

$$+ \frac{4}{3} \text{ (Log. sec. } a - 10) = \frac{2}{3} \times 0002011 = \frac{0.0001341}{8 \cdot 4834478}$$
Hence log. tangent of 1° 44' 36'' \cdot 8

(27) TO FIND A SMALL ARC OF WHICH THE LOGARITHMIC SINE IS GIVEN.

To the given logarithmic sine add 5.3144251, and $\frac{1}{4}$ of the corresponding logarithmic secant, the index of the latter logarithm being previously diminished by 10, and the sum will be the logarithm of the number of seconds in the arc.

EXAMPLE.

Find the arc corresponding to the logarithmic sine 8.4832462.

The arc is found in the ordinary way to be 1° 44′ 36″, and the logarithmic secant of this arc is 10.0002011; hence

Given log. sine	==	8.4832462
Constant number	='	5.3144251
1 (Log. sec 10)	=	0.0000670
L 6276"·8	=	8.7977883

Hence $a = 6276^{\circ} \cdot 8 = 1^{\circ} 44^{\circ} 36^{\circ} \cdot 8$.

(28) To find a small arc, of which the logarithmic tangent is given.

To the given logarithmic tangent add 5.3144251, and from this sum subtract two-thirds of the corresponding logarithmic secant, previously diminishing its index by 10; then the remainder is the logarithm of the number of seconds in the arc.

EXAMPLE.

The logarithmic tangent of a small arc is 8.4834473; required the arc.

It is found in the usual way that the arc is nearly 1° 44′ 86″, and its log. secant = 10.0002011.

Hence $a = 6276'' \cdot 8 = 1^{\circ} 44' \cdot 36'' \cdot 8$.

From the smallness of the differences of the logarithmic secants of small arcs, an error of a few seconds in the arc would cause an error of less than 1 in the sixth decimal place, and generally the error on the required arc from this source would be less than $\frac{1}{10}$ of 1".*

ANGLES CONTAINED BY THE MERIDIAN WITH EVERY POINT AND QUARTER-POINT OF THE COMPASS.

(29) In this table the value of the points and quarter-points contained by any rhumb line and the meridian is given in degrees, &c.

Thus the number of points contained by the rhumb line of N.N.E. or N.N.W. with the meridian is 2 points = 22° 30'.

So the points contained between E.N.E. $\frac{1}{4}$ E. and N.; or between E.S.E. $\frac{1}{4}$ E. and S. are = $6\frac{1}{4}$ points = 70° 18' 45".

^{*} A proof of the rules, from which the above are easily deduced, is given in Woodhouse's Trigonometry, page 262.

LOGARITHMIC SINES, TANGENTS, ETC. TO EVERY POINT AND QUARTER-POINT OF THE COMPASS.

(30) When angles are given in points instead of degrees, it is convenient to know their logarithmic sines, tangents, &c. without converting them into degrees; and these logarithms are given in this table.

Thus the log. tan. of $3\frac{1}{4}$ points = 9.9141732.

AREAS OF THE SEGMENTS OF A CIRCLE, TO DIAMETER = 1.

(31) In this table there are given the height of the segment to diameter = 1, and adjacent to it the area of the segment to diameter = 1. When the diameter is not 1, divide the height of the segment by the diameter; the quotient will be the height to diameter = 1, which call h, and let A represent the central angle, and C the circular measure of the arc of the segment; then \sqrt{h} = the natural sine of $\frac{A}{4}$, from which A can be found; then, from the table of 'Circular Measure of Angles,' C can be found; the tabular area is then = $\frac{1}{2}$ (C - sin. A); from which the table can be calculated.

(32) To calculate the area of a circular segment.

RULE.—Divide the height by the diameter, look for the quotient in the column of heights, and take out the corresponding area, which multiply by the square of the diameter; the product will be the area sought.

EXAMPLE.

The height of a segment is 16, and the diameter 105; find the area.

CIRCULAR MEASURE OF ANGLES, OR LENGTH OF ARCS TO RADIUS = 1.

- (33) To find the circular measure of an arc, the angular measure of which is given; and conversely.
- (a) Find the degrees in the arc at the top of the page, and the minutes at the left-hand side; then, under the degrees and opposite the minutes, is the length sought; but if the angle contain seconds, to this result add the number opposite the seconds on the right-hand side of the page, and the sum will be the length sought.

(b) Conversely: When the length or circular measure is given, find the given length in the table; then the degrees at the top and the minutes at the left-hand side is the angular measure sought, when the length is found in the table exactly; but if the length is not found exactly in the table, take the degrees and minutes corresponding to the next less arc, and subtract this next less arc from the given one, and opposite the remainder on the right-hand side of the page will be found the seconds in the arc.

NATURAL SINES, COSINES, VERSED SINES, AND CHORDS.

(34) The natural sines, cosines, versed sines, chords, &c., contained in this table, are the lengths of these functions of arcs of a circle whose radius = 1. They are all decimal fractions, though the point is not prefixed, except where they are equal to or greater than 1, in which case the point is inserted. Or, they are the lengths of the same functions, in integers, to radius = 10,000,000.

The natural sines and cosines of arcs, also the arcs for any given natural sines or cosines, are found from the table by the same method as that used for logarithmic sines and cosines.

The natural sines and cosines of arcs are easily found from the logarithmic sines and cosines, by merely subtracting 10 from the indices of the latter, and then the number corresponding to this logarithm is the natural sine or cosine required. In the same manner the natural tangents, secants, &c. can be found.

Let s = the natural sine of an arc, and S = the sine of the same arc, whose logarithm is the logarithmic sine; then S = 10,000,000,000 sand LS = 10 + L sor L s = LS - 10.

EXAMPLE.

Given the logarithmic sine of 36° 44', namely, 9.7767676, to find the natural sine of the same arc.

L sine 36° 44' = 9.7767676 Subtract 10° L nat. sine = $\overline{1.7767676}$ Hence natural sine = .5980915

If the chord of an arc greater than 90° be required, take *twice* the natural sine of *half* that arc, and it will be the chord required. Or, let c = the chord of its supplement; then the square root of (2+c) (2-c) = the required chord. Or the chord sought $= \sqrt{4-c^2}$.

Note.—This table can be used for finding the length of a degree of longitude corresponding to any given latitude; thus, multiply the natural cosine of the given latitude by 60, the product will be the length of a degree of longitude in geographical or nautical miles; or multiply the same by 69·121, and the product will be the length in English miles.

শ্বী দ ুল্ল চুক্ত

NATURAL TANGENTS AND COTANGENTS, SECANTS AND COSECANTS.

(35) This table is used in the same manner as the table of natural sines and cosines, namely, by finding the degrees at the top of the page, and the minutes of the angle at the left side of the page, when the quantity sought is a tangent or secant; but the degrees must be found at the bottom of the page, and the minutes at the right-hand side of the page, when the quantity sought is a cotangent or cosecant; the quantity sought will then be found at the angle of intersection of these columns, or it is the only quantity which is common to both columns.

If the given angle contain seconds, find the difference between the quantity corresponding to the minutes in the given angle, and that corresponding to the next higher minute, which will give the change for 1'=60", which call D, and let d be the correction corresponding to the seconds in the given angle, which call s; then

$$60'' : s'' : : D : d$$

$$\therefore d = \frac{sD}{60} = \text{the correction sought.}$$

This correction must be applied by addition if the quantity sought be a tangent or secant, but by subtraction if it be a cotangent or cosecant.

If the angle be sought which corresponds to a given tangent or secant, cotangent or cosecant; find the next less, if it be not found exactly in the table, when the given quantity is a tangent or secant, but the next greater when it is a cotangent or cosecant, and take the difference between it and the given quantity, which call d; also take the difference between this tabular quantity and that corresponding to the next higher minute, which call D: then

D:
$$d$$
:: $60''$: (s = the seconds sought),

$$\therefore s = \frac{60 \ d}{D}$$

EXAMPLE I.

Find the natural tangent of 42° 17′ 43".

EXAMPLE II.

Find the natural cotangent of 42° 17' 43".

Natural cotangent of 42° 17′ 42° 18′	=	1·0996281+ 1·0989857
Difference for $60" = D$	=	6424
$d = \frac{43 \text{ D}}{60} = \frac{43 \times 6424}{60}$	==	4604-
natural cotangent 42° 17′ 43"	=	1.0991677

EXAMPLE III.

Find the angle whose natural tangent is .7342856.

Given natural tangent	===	.7842856
Natural tangent 36° 17'	.	·7841258
∴ d	=	1603
Also natural tangent 36° 18'	22	·7845730
∴ D	=	4477
But $s = \frac{60 \ d}{D} = \frac{60 \times 1603}{4477} = \frac{9}{4}$	$\frac{6180}{1477} = 2$	1 "·5.

Hence '7342856 = natural tangent of 36° 17′ 21".5.

EXAMPLE IV.

Find the angle whose natural cotangent is 2.1583764.

Given natural cotangent =
$$2.1583764$$
Natural cotangent of 24° 51' = 2.1592476
 $\therefore d$ = 8712
Also natural cotangent of 24° 52' = 2.1576015
 $\therefore D$ = 16461
But $s = \frac{60 \times d}{D} = \frac{60 \times 8712}{16461} = \frac{522720}{16461} = 31''.7$.

Hence 2.1583764 = natural cotangent of 24° 51′ 31".7.

(36) The calculations for the secants and cosecants, where the angle involves seconds, is the same as those given above for tangents and cotangents.

DIFFERENCE OF LATITUDE AND DEPARTURE;

OR, TRAVERSE TABLE.

(37) These tables contain the parts of right-angled plane triangles whose greatest sides are integers not exceeding 300; the angles in pages 334 to 349 being given to every quarter-point of the compass, and those from pages 350 to 394 to every degree of the quadrant. If the sides of the proposed triangle should exceed the limits of the table, they may be divided by any number that

will bring the quotients within these limits; and then the results from the table, multiplied by the same number, will give the required parts of the proposed triangle; observing that the angles must in no case be multiplied and divided.

These tables are very useful in resolving problems in Navigation by inspection in which right-angled triangles are concerned, when minute accuracy is not required; and from their use in facilitating the reduction of compound courses to single ones, they are called *Traverse Tables*.

Each angle at the top or the bottom of the page may be considered as the vertical angle of a right-angled triangle, and the side opposite that angle is found in the column marked Dep., the adjacent side in the column marked Lat., and the hypotenuse in the column marked Dist., all adjoining each other in the same line.

Thus, with the vertical angle 33°, and base 128, the perpendicular is found 1971, and the hypotenuse 235. With the perpendicular 115.9, and base 209, the vertical angle is found 61°, and the hypotenuse 239.

With a course of $3\frac{1}{2}$ points, and a distance of 256, the difference of latitude is found 1979 in the column marked Lat, and the departure 1624 in the column marked Dep. With a middle latitude 39° considered as the vertical angle of a right-angled plane triangle, and a departure of 141.2, considered as the perpendicular of the same triangle, we have the difference of longitude nearly 182, as the hypotenuse in the column marked Dist. With a course of 18°, and a meridional difference of latitude of 217 in the column of Lat, we have in the column of Dep. nearly 70.5 for the difference of longitude,

TO COMPUTE THE EQUATION OF EQUAL ALTITUDES.

(38) In taking equal altitudes of the sun, one in the forenoon and the other in the afternoon, since the sun's declination generally changes in the interval, the hour angles corresponding to the two altitudes are not exactly equal. Hence half the interval added to the time of the first observation requires a correction, in order to give the time shewn by chronometer when the sun is on the meridian. This correction is called the 'equation of equal altitudes.'

DIURNAL PROPORTIONAL LOGARITHMS.

(39) Instead of the logarithms in this table being the logarithms of the number of minutes in the time, they are the logarithms of the minutes in $24^{\text{h}} = 1440^{\text{m}}$ diminished by the logarithm of the minutes in the given time; thus, the logarithm in the table for 7^{h} $14^{\text{m}} = 434^{\text{m}}$ is

L 1440 — L 434 or 3·1583625 — 2·6374897 = ·5208728

 \therefore L 7h 14m = .52087 to five decimals.

To work a proportion by this table, let a=24h, b= any less number of hours, or hours and minutes; c= any number of hours and minutes, or degrees and minutes, or minutes and seconds of an angle: then

$$a:b::c:x=$$
 the answer;

and dividing a by each term
$$\frac{a}{a}:\frac{a}{b}::\frac{a}{c}:\frac{a}{x}$$

hence
$$\frac{a}{x} = \frac{a}{b} \times \frac{a}{c}$$
 since $\frac{a}{a} = 1$

$$\therefore \mathbf{L} \, \frac{a}{x} = \mathbf{L} \, \frac{a}{b} + \mathbf{L} \, \frac{a}{c}$$

and therefore the tabular logarithm of x = the sum of the tabular logarithms of b and c.

EXAMPLE.

If the change in right ascension of a body be 6° 21' in 24h, what will be its change in 17h 25m?

Here we have	24h: 17h 25m	::6°	21' : x	
but	L 17h 25m	=	·13925	
and	L 6° 21′	=	·57744	
	L 4° 86′ 29″	_	·71669	Snm

Hence the change sought = 4° 36' 29".

TERNARY PROPORTIONAL LOGARITHMS.

(40) The logarithms given in this table are the remainders found by subtracting the common logarithm of the seconds in the time, from the logarithm of the seconds in three hours = 10800 seconds; thus, the logarithm of 1h 50m 19s = 6619s is

 \therefore L 1h 50m 19s = 21263 to five decimals.

EXAMPLE.

If the moon's change of declination in three hours be 6' 18", what will be its change in 2h 45m 30s?

Therefore the change sought = 5' 47".5.

AMPLITUDES.

(41) By means of this table the true amplitude is taken out by inspection, whereby the method of finding the variation of the compass, by comparing the magnetic with the true amplitude, is very much facilitated. The table is to be entered with the declination at the top, and the latitude in the left-side column, and under the declination and opposite to the latitude will be found the amplitude sought. When there are minutes in the declination or latitude, or in both, take proportional parts of the change for one degree, and apply the result to the quantities given in the table.

SEMI-DIURNAL AND SEMI-NOCTURNAL ARCS.

(42) This table shews half the time that a celestial object continues above the horizon, when the declination and latitude are of the same name, or below it when they are of contrary names; hence, from it the apparent time of its rising and setting may be obtained.

The table is to be entered with the latitude in the left-hand column and the declination at the top; in the angle of meeting will be found the arc required, which, if the object be the sun, will be the apparent time of his setting when the latitude and declination are of the same name, and of his rising when they are of contrary names; this subtracted from 12 hours will give the apparent time of the sun's rising in the former case, and of his setting in the latter; double the time of his rising will be the length of the night, and double the time of his setting the length of the day.

The semi-diurnal arc expresses the time that a celestial object takes in ascending from the eastern horizon to the meridian; or of its descending from the meridian to the western horizon.

EXAMPLE.

Suppose in latitude 51° 30′ N., when the sun's declination is 20° N., it be required to find the apparent time of the sun's rising and setting, with the length of the day and night.

Under dec. 20°, and taking half the sum of that corresponding to 51° and 52°, we get for the apparent time of sun setting Which being taken from	h. m. 7 49 12 0
Gives the apparent time of the sun's rising	4 11
Then $7^h 49^m \times 2$, gives for the length of the day And $4^h 11^m \times 2$, gives for the length of the night	15 38 8 22

TO FIND THE APPARENT TIME OF A STAR'S RISING AND SETTING.

(43) Subtract the sun's right ascension from the star's right ascension, increased, if necessary, by 24 hours; the remainder will be the approximate time of the star's passing the meridian.

Then, with the latitude of the place and the star's declination, enter the table,

and find the semi-diurnal arc corresponding thereto, which being subtracted from the time of the meridian passage, will give the time of the star's rising, and added to the same will give the time of its setting.

To obtain the mean time of the sun or a star's rising or setting, the equation of time, taken from the *Nautical Almanac*, must be applied to the apparent time found as above.

The mean time of the rising and setting of the planets may be computed as above, by taking out their declination and meridional passage from the *Nautical Almanac* for the given year.

TO FIND THE TIME OF THE RISING AND SETTING OF THE MOON.

(44) Take the mean time of the moon's meridional passage at Greenwich from page iv. of the *Nautical Almanac*, and to it apply the correction from table, page 432, to obtain the time of her meridional passage at the given place.

Then, with the moon's declination at the time of her passing the meridian $(N. A., page v. to xii. of each month), and the latitude of the place, find the semi-diurnal arc, and increase it by <math>\frac{1}{10}$ th of itself, subtract the sum from the time of the meridional passage, and the remainder will be the time of her rising nearly; again, add the same increased arc to the time of the meridional passage, the sum will be the time of her setting nearly.

(45) If still greater accuracy be required, take from the Nautical Almanac the moon's declination corresponding to the approximate times of rising and setting as found above, reduced to Greenwich time; find the semi-diurnal arcs corresponding to each declination and the latitude of the place; then, from Table (396-7) add the logs. of the semi-diurnal arcs thus found, and that of the daily change of the moon's meridional passage; the sums will be the logs of the corrections to be added to these arcs to find the true semi-diurnal arcs; then apply each of the results to the time of the moon's meridional passage as directed above, and the times of rising and setting will be found very near the truth.

MERIDIONAL PARTS.

(46) The table of meridional parts is used in nautical computations in Mercator's sailing, and in finding the lengths of the meridian lines on maps constructed on Mercator's projection; it can be calculated from the formula—

Mer. pts. = 7915·7046 {Log.₁₀ tan.
$$(45 + \frac{l^2}{2}) - 10$$
}, l^2 being the latitude.

EXAMPLE I.

To find the meridional difference of latitude for two given latitudes, namely, 57° 9′ N. and 35° 1′ N.

M. P. for 57° 9' = 4199·2 N. M. P. for 35° 1' = 2245·5 N. Meridional diff. lat. = 1953·7 When the latitudes are of different names, the meridional parts for the two given latitudes are to be added, and the sum will be the required meridional difference of latitude.

EXAMPLE II.

A ship has sailed northerly till her meridional difference of latitude is 1052, and the latitude of the port sailed from was 88° 17′ N.; required the latitude in.

M. P. for 38° 17' Meridional diff. lat.	=	2489·9 N. 1052·0 N.
M. P. for 50° 43'	_	8541.9 N

The latitude in is therefore 50° 48'.

When the given latitude of the place sailed from and the meridional difference of latitude have different names, the difference between the meridional parts of the latitude sailed from and the meridional difference of latitude must be taken, and the required latitude corresponding to this difference will be of the same name with the latitude sailed from, when the meridional parts for the latter exceed the meridional difference of latitude, but of a different when they are less.

EXAMPLE III.

The latitude left is 15° 9′ N., and the meridional difference of latitude is 695.6 S.; required the latitude in.

M. P. for 15° 9'	=	919·8 N.
Meridional diff. of lat.	=	695·6 S.
M. P. for 3° 44'	=	224·2 N.

Hence the latitude in is 3° 44' N.

EXAMPLE IV.

The latitude left is 11° 36′ N., the meridional difference of latitude is 1238 S.; required the latitude in.

M. P. for 11° 36'	=	700·8 N.
Meridional diff. of lat.	=	1238·0 S.
M. P. for 8° 55'	=	537·2 S.

Hence the latitude in is 8° 55' S.

APPARENT DEPRESSION OF THE HORIZON.

(47) The apparent depression of the horizon for any height of the eye not exceeding 110 feet, is given in this table. The principle on which it is constructed is explained in article 855 of the *Practical Mathematics*.

The depression, for example, of the horizon when the height of the eye is 30 feet, is 5' 18", and this is to be subtracted from the observed altitude.

If the observed altitude is 40° 18' 9", and the height of the eye 12 feet, then opposite to 12 is the dip 3' 21"; hence—

Observed altitude = 40° 18′ 9″ Dip for 12 feet = -0 3 21 Apparent altitude = 40 14 48

DIP OF THE SEA AT DIFFERENT DISTANCES FROM THE OBSERVER.

(48) When the altitude of an object is to be taken, and the horizon is not bounded by the sea in consequence of intervening land, the altitude is taken from the line bounding the sea and land; and as this line is lower than the horizon, the correction for its depression will be greater than that for the depression of the sea horizon, and the more so the nearer this line is to the eye of the observer. The quantity of this depression is given in the table.

The depression, for example, when the height of the eye is 30 feet, and the bounding-line 2½ miles distant, is 8'.

Let the observed altitude = 32° 14' Then dip for 30 feet and $2\frac{1}{2}$ miles of distance = 0 8 Hence apparent altitude = 32° 6

CONTRACTION OF THE SEMI-DIAMETERS OF SUN AND MOON.

(49) In the uppermost line of this table is the altitude of the sun or moon, and in the left column is the inclination of that semi-diameter to the horizon, whose contraction is required. (See *Practical Mathematics*, article 846.)

Thus, for an altitude of 10°, the contraction of the vertical diameter, whose inclination to the horizon is 90°, is 8"; for an altitude of 14°, and an inclination of 45°, the contraction is 2".

Also, when the horizontal semi-diameter of the moon is 15' 30", and its altitude 12°, its semi-diameter, which is inclined 60° to the horizon, is

$$= 15' 30'' - 4'' = 15' 26''$$

REDUCTION OF MOON'S EQUATORIAL PARALLAX.

(50) In the top line of this table is contained the horizontal equatorial parallax registered in the *Nautical Almanac*; and the correction to be applied to it, in order to reduce it to the horizontal parallax for any latitude, is given in the column under it, and opposite to the latitude, which is contained in the left column. The correction is always subtractive.

Thus, for example, the reduction for a registered parallax of 54' 20", and the latitude of 36°, is 3".7; hence the horizontal parallax for the given latitude is

$$= 54' 20'' - 3'''7 = 54' 16'''3.$$

MEAN REFRACTION.

(51) In this table, the mean refraction is given for the pressure 29.6 inches, and temperature 50°. The principle on which it is computed is explained in Prob. VIII., article 852, of the *Practical Mathematics*.

The refraction for an altitude of 32° 10′ is found opposite to it in the next column, and is 1′ 30″.

Apparent altitude	=	32°	10' 0'	,
Mean refraction	=	0	1 80	
True altitude	=	32	8 80	

CORRECTION OF MEAN REFRACTION.

(52) When the pressure and temperature differ from 296 and 50°, the correction can be computed by the formula in article 853 of the *Practical Mathematics*.

In the preceding example, in which the apparent altitude is 32° 10′, let the temperature and pressure be 69° and 30°35, instead of 50° and 29°6; then the correction in the table for

Altitude 32° 10′ and temperature 69° is	=	— 0°	, 0,	4'	,
Altitude 32° 10′ and pressure 30.35 is	= ;	+ 0	0	2	
Correction for both is	=	– 0	0	2	
Mean refraction	=	0	1	30	
True refraction	=	0	1	28	
Apparent altitude	=	32	10	0	
True altitude	=	32	8	32	

SUN'S PARALLAX IN ALTITUDE.

(53) This table contains the altitude of the sun in one line, and its parallax in the adjacent line, which is always additive to the altitude.

BESSEL'S REFRACTIONS.

(54) Professor Bessel, of Königsberg, constructed the table given as Bessel's Refractions, which is now generally used where great accuracy is required. In addition to the observed apparent altitude, it is necessary to ascertain the height of the barometer, upon which depends the factor B; also of the thermometer attached to the barometer, upon which depends the factor t; and of the temperature of the external air, upon which depends the factor T. If the attached thermometer is not observed, we may assume that its indications are the same as those of the external thermometer.

The refraction may be computed either by natural numbers or by logarithms. The latter method is the more accurate, as the corrections required for small altitudes, indicated by the factors M and N, can be conveniently applied only with logarithms. When the altitude is not small, and the greatest accuracy is not required, the use of logarithms may be dispensed with.

BY NATURAL NUMBERS.—Let R =the mean refraction in seconds taken from the table, and B, t, and T, as stated above; then the true refraction in seconds $= R \times B \times t \times T$.

EXAMPLE.

The observed altitude of a star was 38° 17′ 45″; the barometer, 30.57 inches; the attached thermometer, 40° 7 Fahr.; and the external, 41° 3 Fahr. It is required to compute the refraction.

Mean refraction for 38° 17′ 45″ is 1′ 18″ = 73″ = R. Barometer, 30.57; factor B, 1.033. Attached thermometer, 40°.7; factor t, 0.999. External thermometer, 41°.3; factor t, 1.014. B × t × T = 1.033 × 999 × 1.014 = 1.046. True refraction = 73″ × 1.046 = 76″.3 = 1′ 16″.3.

By Logarithms.—Take from the table the factor log. B, corresponding to the height of the barometer; and the factors log. t and log. T, corresponding to the attached and external thermometers. Also take log. A and M and N corresponding to the apparent altitude. Multiply the sum of log. B and log. t by M; also multiply log. T by N. Take the algebraic sum of these products, and add to it log. A, and the logarithmic cotangent of the apparent altitude. The sum will be the logarithm of the refraction expressed in seconds of arc. The rule is expressed algebraically as follows: The logarithm of the refraction in seconds is = log. cotan. app. alt. + log. A + M (log. B + log. t) + N log. T.

EXAMPLE.

The observed apparent altitude of a star was 7° 10′ 15″; the barometer, 29.98 inches; the attached thermometer, 53°.4 Fahr.; and the external thermometer, 51°.6 Fahr. Required the refraction.

```
0.90028 M = 1.0073

                                          = -0.00258
                                               2.63599
               .. log. refraction
                      Refraction
                                           = 432''\cdot 5 = 7' 12''\cdot 5
```

CORRECTION OF MOON'S MERIDIAN PASSAGE.

(55) In the top line of this table is contained the daily retardation corresponding to the registered meridian passage, and in the left column the longitude; under the former and opposite to the latter is the correction to be applied to the time of the registered passage at Greenwich on the given day, to obtain the meridian passage at the given place. It is to be applied by addition for west, and by subtraction for east longitude. (See an example and explanation in the *Practical Mathematics*, articles 869 and 870.)

AUGMENTATION OF MOON'S SEMI-DIAMETER.

(56) In this table the moon's horizontal semi-diameter is given in the top line, and its apparent altitude in the left column; under the former and opposite to the latter is the augmentation, or increase in the moon's apparent semi-diameter, on account of her being nearer to the observer than when in the horizon.

Thus, for the horizontal semi-diameter 15' 20", and altitude 21°, the augmentation is 5"5; hence the augmented semi-diameter

$$= 15' 20'' + 5'' \cdot 5 = 15' 25'' \cdot 5$$

MUTUAL CONVERSION OF SIDEREAL AND MEAN TIME.

(57) In this table the given time, whether mean or sidereal, is to be found in the left column; and in the next column to the right is the corresponding correction to be applied by addition or subtraction, according as sidereal or mean time is required.

The correction to be subtracted from sidereal time is called the *retardation* of mean on sidereal time; and the correction to be added to mean time is called the *acceleration* of sidereal on mean time.

The upper half of the table is used for changing solar into sidereal time by adding the correction; and the lower half for changing sidereal into solar time by subtracting the correction.

EXAMPLE.

Given 10h 18m 58s 32 of mean time, to find the corresponding sidereal time.

						h.	m.	s.	
Given time					±	10	18	58.32	mean time.
		h.	m.						
Acceleration	on	10	0	0	=	0	1	38.57	
	Ħ	0	18	0	=	0	0	2.96	
"	"	0	0	58	=	0	0	0.16	
•	#	0	0.	0.32	=	0	0	0.00	
		10	18	58.32	=	+ 0	1	41.69	
Requ	ired	sic	lere	al time	=	10	20	40.01	

For an example in reducing sidereal to mean time, see Practical Mathematics, article 865.

For a table of time equivalents, see Nautical Almanac, pages 488 to 491.

REDUCTION OF DEGREES TO TIME.

(58) This table is used for reducing longitude to time at the rate of 15° to 1h. The degrees, minutes, or seconds are given in the odd columns, and the corresponding time in the even columns. When the first column is reckoned degrees, the second is hours and minutes of time; and when the first is minutes of space, the second is minutes and seconds of time; and so on.

EXAMPLE.

Convert 161° 5' 20" of longitude into time.

		n.	m.	B.,
160°	===	10	4 0	0
1°	=	0	4	0
5′	===	0	0	20
20″	=	0	0	1.3
Required time	=	10	44	21.8

REDUCTION OF TIME TO DEGREES.

(59) This table is the converse of the preceding. The time is given in the odd, and the longitude in the even columns. The corresponding denominations of time and space are to be understood as in the preceding table.

EXAMPLE.

Convert 5h 22m 10s 40t to longitude.

5h	==	75° 0′ 0 ′
22m	=	5 30 O
10s	=	0 2 30
40 t	=	0 0 10
Required longitude	=	80 32 40

MEAN MOTION OF SUN FOR PERIODS OF MEAN TIME.

(60) This table gives, in parts of space, the mean motion of the mean sun in right ascension for periods of mean time.

Thus, the sun's mean motion in right ascension in 10 hours of mean time is = 24' 38''.469, and in 10 days it is 9° 51' 23''.25.

The mean motion in the table is just equivalent to the retardation in mean time on the corresponding tabular mean time, or to the acceleration in sidereal time on the corresponding tabular time considered as sidereal.

The corresponding mean motion in parts of space in this table, and the accelerations and retardations in the table, page 433, are therefore equivalents.

Thus, for 24 hours mean time, the mean motion is 59' 8".325; the retardation, 3m 55s.91 mean time; and the acceleration is 3m 56s.56 sidereal time.

Sinc	e 24h s.t.	=	24h m.t.	_	3m 55s 91 m.t.
Therefor	e 24h m.t.	=	24h s.t.	+	3m. 55s·91 m.t.
Also	24h m.t.	=	24h s.t.	+	'3m 56s·56 s.t.
And	24h m.t.	=	360°	+	59′ 8 ″ ′-325
Also	24h s.t.	=	360° of eq	uator, w	herefore
	59' 8":325	=	3m 56s.56	s.t. =	3m 55s·91 m.t.

By converting the time in this table, considered as sidereal, into its value in parts of space (by table, page 434), and adding to it the corresponding mean motion, the sum will be the value of the time, considered as mean time, expressed in parts of the equator.

Thus,
$$24^h$$
 m.t. = 24^h s.t. + $59'$ 8" 325
= 360° 59' 8" 325.

DISTANCE OF THE VISIBLE HORIZON.

(61) By means of this table the distance of the visible horizon corresponding to any given height can be found by inspection; and conversely.

EXAMPLE.

The distance of the visible horizon for a height of 720 feet is 28.53 miles.

This is, however, the tangential distance; and if the actual distance is required, a correction for refraction must be added. (See *Practical Mathematics*, articles 587 and 594.)

Thus, if the refraction at the time of observation increases the distance has then the actual distance for the above example is

$$= 28.53 + 2.85 = 31.38$$
 miles.

When the distance of the horizon seen from any height is given, the height can be found by the same table. In this case the actual distance is previously to be reduced to the tangential distance by subtracting a necessary correction for refraction.

When the given height is beyond the limits of the table, take $\frac{1}{4}$, $\frac{1}{4}$, or $\frac{1}{16}$... of it, and multiply the corresponding distance by 2, 3, or 4... respectively, and the result is the tangential distance. The reason of this rule is, that the heights are proportional to the squares of the distances.

Thus, if the height is 10200, take its fourth, 2550, and the corresponding distance 53.7 multiplied by 2, gives 107.4, the tangential distance for 10200 feet.

In practice, however, the use of the table ought to be limited to 60 or 80 miles.

REDUCTION OF THE MOON'S HORIZONTAL PARALLAX AND SEMI-DIAMETER TO ANY GIVEN GREENWICH DATE.

(62) Find the change in the horizontal parallax or semi-diameter for 12 hours at the top of the table, and under that change, and opposite to the time on the left for which the correction is required, will be found the seconds to be applied by addition or subtraction, according as the quantity whose correction is required is increasing or decreasing.

BINOMIAL COEFFICIENTS FOR INTERPOLATION BY DIFFERENCES.

(63) In this table, if
$$t =$$
 the part, the 2d diff. $= \frac{t(t-1)}{1 \cdot 2}$, the third diff. $= \frac{t(t-1)(t-2)}{1 \cdot 2 \cdot 3}$, the 4th diff. $= \frac{t(t-1)(t-2)(t-3)}{1 \cdot 2 \cdot 3 \cdot 4}$, and the 5th diff. $= \frac{t(t-1)(t-2)(t-3)(t-4)}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5}$. When t is $+$, the 1st, 3d, and 5th differences are $+$, and the 2d and 4th $-$, but if t is $-$, the 1st, 3d, and 5th are $-$, and the 2d and 4th $+$.

- LINKS TO BE SUBTRACTED FROM EACH CHAIN IN AN ASCEND-ING OR DESCENDING LINE, IN ORDER TO REDUCE IT TO THE HORIZONTAL PROJECTION.
- (64) In measuring inclined lands, the lines measured in an acclivity or declivity being longer than their projections on the horizontal plane, must be reduced according to the angle of ascent or descent.

The number of links to be deducted from each chain, for any number of degrees in the angle, as far as 23° 4′, are given in Part I. of the table.

The Second Part contains the angles to which corresponds a reduction of a whole number of links or quarter links. As it is more convenient to subtract these numbers than those in Part I., the angle in Part II. nearest to the observed angle may be chosen, and the corresponding number of links used for reduction, which will generally be sufficiently correct in practice. If greater accuracy is required, multiply the measured length into the natural cosine of the inclination to the horizon (Table, page 263).

EXAMPLES.

- 1. For an angle of 9°, the reduction by Part I. on a line of 12 chains, would be $12 \times 1.24 = 14.88$ links, and the horizontal line is = 1200 14.88 = 1185.12.
 - 2. For the same angle and line, the reduction by Part II. is $12 \times 1\frac{1}{4} = 15$ links, and the horizontal line is = 1200 15 = 1185 links.

HEIGHT OF APPARENT ABOVE TRUE LEVEL.

(65) This table is very useful in levelling, as it contains the corrections to be deducted from the height of a point on apparent level with another point, in order to determine that which is on a true level with the latter.

Thus; for a distance of 100 chains, the correction is 111 inches.

So for a distance of 80 chains, or 1 mile, the correction is 8 inches. But if refraction is taken into account, the correction will be $\frac{1}{3}$ less, or = 8 inches $- 1\frac{1}{3}$ inch $= 6\frac{3}{4}$ inches. Or $h = \frac{5}{4}$ $d^2 = \frac{5}{5} \times 1^2 = \frac{5}{5}$ feet = 6.7 inches.

AREAS, APOTHEMS, AND ANGLES OF POLYGONS.

(66) This table contains the apothems, areas, interior and central angles of polygons for the side = 1; for any other length of side, multiply the tabular apothem by the given length of the side, and the tabular area by the square of the length, and the products will be the apothem and area sought. The angles remain the same whatever the length of the side may be.

QUARTER SQUARES OF ALL NUMBERS, FROM 1 TO 5100.

(67) This table is used for performing multiplication by addition and subtraction alone: for, since $\frac{1}{2}(a+b)^2 - \frac{1}{4}(a-b)^2 = ab$; if a = the multiplicand and b = the multiplier, then the quarter square of their sum, diminished by the quarter square of their difference, gives their product; thus, let a = 786, and b = 247, then (a+b) = 983, and (a-b) = 489;

: $ab = 736 \times 247 = 181792$ diff. = product.

Also, if a = 593, and b = 406, then (a + b) = 999, and (a - b) = 187; But Q. sq. of 999 = 249500

And Q. sq. of
$$187 = 243000$$

And Q. sq. of $187 = 8742$

 $\therefore ab = 593 \times 406 = 240758 \text{ diff.} = \text{product.}$

Note 1.—The quarter squares of all odd numbers are given here 1 or 25 too small; but this never causes any error in the calculation, for if the sum of two numbers be odd, so is their difference, and the fourths destroy each other.

Note 2.—This table may also be used for obtaining the squares of numbers; for, if the quarter squares be multiplied by 4, the product will be the square of the number, if it be even; and increased by 1, will be the square if the number be odd; or, the quarter square of double the number is always the square of that number.

CONVERSION OF THE DIFFERENT THERMOMETRIC SCALES.

(68) The conversions in this table apply only to integral degrees; the equivalents of fractions being readily ascertained by proportion from the difference between the equivalent of the degree given and that of the next higher in the table; but any of the scales may be converted into the other by the following formulæ:

Let F° = the Fahrenheit degrees; R° = the Reaumur; C° = the Centigrade.

Then
$$F^{\circ} = \frac{3}{4} R^{\circ} + 32^{\circ} = \frac{3}{8} C^{\circ} + 32^{\circ}$$

 $R^{\circ} = \frac{4}{8} C^{\circ} = \frac{4}{8} (F^{\circ} - 32^{\circ})$
 $C^{\circ} = \frac{5}{8} (F^{\circ} - 32^{\circ}) = \frac{5}{4} R^{\circ}$

#### LINKS TO BE SUBTRACTED FROM EACH CHAIN

#### IN AN ASCENDING OR DESCENDING LINE IN ORDER TO REDUCE IT TO THE HORIZONTAL PROJECTION, OR PLOTFING MEASURE.

If greater accuracy is required, see explanation of Table, page xli.

#### NUMBERS OFTEN USED IN CALCULATIONS.

		Log.
Area of a circle to radius 1	8.1415926536	0.4971499
Circumference of a circle to diameter 1		1
Surface of a sphere to diameter 1	A MONAGON 60 4	
Area of a circle to diameter 1 = 1/4 =	0.000001001	Ī-8950899
Volume of a sphere to diameter 1 = is =		Ī·7189986
Volume of a sphere to radius 1 = ‡# =		0.6220886
Diameter of a circle to area 1 $= \sqrt{4 + \pi} =$		0.0524550
Diameter of a sphere to volume 1 $=\sqrt[3]{6 \div \pi}$		0.0936671
√x   = -2 =	_ ,,	0.2485749
		0.9942997
1÷= =		1.5028501
$1 \div s^2 =$		1 0057003
Base of Naperian logarithms = 6 = Modulus of the common logarithms = M = M	2.7182818285	0.4342945
		1.6877843
Naperian logarithm of s	1.1447298858	0-0587030
Arc equal to radius expressed in degrees =		1.7581226
minutes =		8.5362739
seconds =		5'8144251
Length of one degree in parts of radius		2-2418773
Length of one minute in parts of radius		4.4637261
360 Degrees expressed in seconds		6.1126050
24 Hours expressed in seconds of time		4-9865137
12 Hours expressed in seconds of time	43200	4.6854837
Number of feet in 1 mile	5280	8.7226339
Sidereal year in mean solar days	865-256374417	2.5625978
Sidereal rotation of earth in mean solar seconds		4 9853264
	sidereal time.	2.8789328
	solar time	2.3727453
Equatorial radius of the earth in English feet	: <b>20923600</b>	7.3206364
Polar radius of the earth in English feet	90853657	7:3191822
Degree of latitude at the equator in English feet. = Degree of latitude at 45° in English feet. = =	: <b>362748·33</b> : <b>864571·77</b>	5.5596054
French toises into French mètres	: 80467177 : 1:94908659	5-5617830
1	. 1.040000000	0.2898200
French toises into English feet ==================================	: 6:89459252 : 1:06576542	0.8058129
French netres into English yards.	: 1.00670042 : 1.098633067	0.0276716
French toises into English feet. = French feet into English feet. = French mètres into English yards. = French mètres into English inches = French kilomètres into English miles. = French kilomètres into English miles. = French kilomètres into English miles.		0.0888716
French kilomètres into English miles.		1.5951741
French kilogrammes into lbs. avoir. =		1.7988590
French litres into imperial gallons.		0.8488340
Length of seconds pendulum in inches, at London	: 220215 : 39·13929	1-3428469
Length of seconds pendulum in inches, at London		1.5926129
Paris = New York =		1.5925019
Velocity of falling bodies in feet at the end of the first second—	. 99.T0TZ	1.5921901
at London	: <b>82·1907</b> 8	4 ********
at London = Paris = -		1.5077315
Paris		1.5076204
